

# Awaken versus The Blind (AvsTB.com)

As shared by Tootah with many people over the last 1000 years.

Polar Drives: #1 and #2

Both #1 and #2:

- Have two arms, a Short Arm (1a and 2a) and a Long Arm (1b and 2b)
  - Long Arm on #1a is the outside Arm
  - Long Arm on #2B is just inside Long Arm #1a
  - Short Arm on #1b is just inside Long Arm #2B
  - Short Arm on #2a is the inside Arm
- 1a and 2a are Polar Opposites to 1b and 2b.
- Counter Rotating Spheres, Spin Opposite directions at over 1001 mph/1610 kph NEVER AT THE SAME SPEED.
- Each have a “Polar Lance” (#4a and #4b) and are polar opposites.
  - MagSphere, Lance each are about 1/3 distance between 1 and 2 poles.
  - PowerStar, Lance each are about ¼ and you will use a rubber or some stable dielectric coating (#7)

Grounding Cables #3 (Blue) and Ring Stabilizer

- Connects to the “Grounding Sphere”

Grounding Ring #5 (Green)

- Ring Pins (#5 Red) attract the energy from both poles.
- Ring pins (#5 red) are equal distance from the center as the “Polar Lances.”

Grounding Sphere #6

- Surrounds the device with holes at both polar caps
- The power collected by the ground will be enough to continue powering the device once started.

Polar Deflectors #8a and #8b may or may not be needed depending on the apposing power.

Base Spin must be an equal count around the clock. Counting when the big arms align at opposite sides of the sphere like the clock. Example of a count would where the alinement was on both 12 o'clock and 6 o'clock, then next would be at one minute past 12 and 31, then 2 and 32, 3 and 33 and so on. An organized pattern around the clock. This creates a pulsing action that repels and pulls the energy dissipation from the poles.

# Awaken versus The Blind (AvsTB.com)

As shared by Tootah with many people over the last 1000 years.

MagaSphere: Changing the speeds of the rotations will either move the electromagnetic sphere (MagSphere) away from center or towards the center. Away from center will create shield that will deflect light speed particles in space. Used on Ships or to surround a settlement.

PowerStar: Moving the Sphere towards the center will create a mini star / blackhole (PowerStar), if stabilized creates a power source cleaner stronger than anything we have created yet and be the foundation of close to FTL drives.

Other uses: Anti-Gravity: Capabilities and Atom Wave Generators, which can be weaponized or used as propulsion.

In the world of the physical Opposites Attract. In the world of Energy, Like Energy is attracted to Like Energy or moves through it unopposed.

New logic framework:

- Current logic: Create lots of thrust power out the ass end of a rocket to push through the opposing force of the gravitic electromagnetic shield.
- Although this drive can mimic the same type of force and in the beginning (I expect) that is what you will do.
  - How? by putting polar deflectors around half the drive (a salad bowl like dish) under a rocket and pointing it the opposite direction you're wanting to go. Similar idea for anti-gravity like tech. You could also use an atom wave generator for that, you point a particle at the salad bowl and then turn it into a wave as it hits the bowl, creating thrust or lift with almost no power, can be a power generator as well...
- When working with polar drive they can work differently, using an in synced pull and push force. Not the type of push a rocket or a plane does.
  - Example: put a pile of marbles down on the floor all touching each other. Put a toy spaceship or plane in the center of those marbles. Using your current technology, you would fire up a rocket and blow all those marbles out of your way as fast as you can to generate thrust. Here is the difference in logic, You could push the marbles on the outside of the pile and it would push the ship in some random uncontrolled direction. That is the kind of push I am talking about, except it a more organized way. In our current reality a plane doesn't really fly, it is thrust using gas powered engines and we have engineered ways to control the direction the plane goes as the engines attached to the plane generate the thrust. The Polar-Drives or MagaSphere does not have to work that way, it can generate an electromagnetic field around the ship, when you learn how to control the flow of energy, all the marbles in around the ship would pull or push in the direction you want to go.

I tell you all that because to figure it out, you will have to know the possibility, and going forward in its creation, develop sensors that can paint you a picture.

Polar-Drives can be used in many ways, engines of various sorts, shields around both ships and settlements (to deflect FTL particles), clean self-sustaining power-source.
